

Dear Low:

My "object" in Pegasus has moved west toward 71 Pegasi. At 3:00 June 23/24, 1963, it was about 2/5 of the way between the 8th mag star east of 71 Peg, and 71 Peg. Included here is an awfully small drawing to show its position:

The orientation shown here is not in error, this nutty telescope is just that way.

Position @ 0300 June 23/24, 1963:

RA 23h33m Dec 22°00'N

Mag 10 or 11
