

Ryerson Physics

U. of C. Chicago. April 5. 96

My dear Lindsay - I have written out from memory and at first, for my own sake these notes of a paper by Prof Michelson on the X rays. Since writing them out I have thought that the members of the Astronomical and Physical Society would be interested in the views of such an eminent Physicist as Prof Michelson. I therefore have pleasure in letting you have the very incomplete and perhaps in some places inaccurate synopsis of these views.

As the paper of Prof M. has not yet appeared in print I may ask you not to print this, though you may mention the leading points of the nature of his views.

I might, had I time, have added some observations of my own but you probably have had a surfeit of X rays. - an excess so to speak,

(over)

As these notes are all I have - have n^t time
to write duplicate - I shall be pleased if you
return them to me after you have made what
use you can, of them.

You might get Mr Collins, (or you are well able to
do it yourself) to show the properties of vortex rings
illustrating the points named

Sincerely yours
G. S. Hull
