JANUARY

COSMIC FLUORESCENCE At 1 500 light-years away in the constellation of Perseus lies the California Nebula, so named because it resembles the shape of that state. The nebula visually is difficult to detect but can be seen from dark sites and with the aid of an H-β filter. Nearby Xi Perseus, a highly energetic type O7 star, excites the H-β line, which causes the nebula to shine. | IMAGE BY STUART HEGGIE

THE PLANETS THIS MONTH

Mercury	very low in ESE in morning twilight with increasing difficulty toward the end of month
Venus	very low in WSW in evening twilight
Mars	very low in WSW at dusk, sets in WSW near 8 pm
Jupiter	in E in evening twilight, transits near midnight, low in WNW at dawn
Saturn	rises in SE after 3 am, in S near dawn

Times in the upper half of the daily boxes are in the 24-hour clock; times in the lower half are given in the 12-hour clock.

Eastern time is used, except for rise and set events and changes to/from Daylight Saving Time, which are given in local time.

Times for events involving planetary satellites refer to the start time.

Detailed instructions on adjusting times for location are given in the back pages.

Please see back pages for photo details and additional information about this Calendar.

MARCH

ONE MOON, TWO FACES The waxing crescent Moon in springtime presents the best chance for observers to see the earthshine on the dark side of the Moon. In this composite image, the crescent view can be seen at right while it is overexposed on the left image to capture the earthshine, sunlight reflected off the Earth onto the Moon thus illuminating it. | PHOTO BY MICHAEL WATSON

Times in the upper half of the daily boxes are in the 24-hour clock; times in the lower half are given in the 12-hour clock.
Eastern time is used, except for rise and set events and changes to/from Daylight Saving Time, which are given in local time.
Times for events involving planetary satellites refer to the start time.
Detailed instructions on adjusting times for location are given in the back pages.
Please see back pages for photo details and additional information about this Calendar.

APRIL

SILVER COIN The Sculptor Galaxy (NGC 253) is also known as the Silver Coin Galaxy for its resemblance to its namesake. It is located near the south galactic pole and is the largest of the Sculptor Group of Galaxies, which is the nearest to our local group of galaxies. A southern-sky splendour, it is an object not to be missed by anyone travelling below the equator. | IMAGE BY DEBRA AND PETER CERAVOLO

THE PLANETS THIS MONTH

- Mercury** low in WNW in evening twilight first week of month, lost after mid-month
- Venus** low in WNW in evening twilight
- Mars** not observable this month
- Jupiter** in W after dark, sets in WNW near 2 am
- Saturn** in SE at dusk, transits in S near 2 am, in SW near dawn

3
40°N 50°N
Set 5:49 5:33
Rise 19:36 19:56
Full Moon
23:42

Today's full Moon is the Flower Moon
Halley discovers Baily's Beads and solar prominences, 300 years ago

4
40°N 50°N
Set 6:25 6:04
Rise 20:35 20:59

Moon 6° W of Saturn this evening

5
40°N 50°N
Set 7:05 6:40
Rise 21:33 22:01

Moon 7° E of Saturn this evening
lo partially eclipses Europa for 5 min. Drop 0.6 mag.
Visible in W of N. America 4:13 am

6
40°N 50°N
Set 7:51 7:22
Rise 22:30 23:00

Eta Aquariid meteors (ZHR=40) 8 am

7
40°N 50°N
Set 8:41 8:12
Rise 23:24 23:53

Mercury at greatest elongation (21° E). Best evening apparition of the year (m=0.4)
Venus 2.5° right of star cluster M35 next few evenings

8
40°N 50°N
Set 9:38 9:09
Rise — —

Mercury 2.5° upper left of Pleiades, separating this week, difficult in bright evening twilight

9
40°N 50°N
Set 10:38 10:12
Rise 5:51 5:24
Sunrise 20:02 20:30

10
40°N 50°N
Rise 0:59 1:22
Set 11:42 11:21

MOTHER'S DAY
Texas Star Party, Fort Davis, Texas, www.texasstarparty.org (through May 17)
Venus 2° above M35

11
40°N 50°N
Rise 1:41 1:59
Set 12:49 12:33
Last Quarter
6:36

12
40°N 50°N
Rise 2:20 2:32
Set 13:57 13:48

Lunar Curtiss Cross visible in E of N. America 3:00 am

13
40°N 50°N
Rise 2:57 3:03
Set 15:06 15:04

Ganymede partially occults Callisto for 9 min 11:07 pm

14
40°N 50°N
Rise 3:34 3:33
Set 16:15 16:21

15
40°N 50°N
Rise 4:11 4:03
Set 17:25 17:37

lo partially eclipses Europa for 5 min. Drop 0.5 mag.
Visible in E of N. America 7:38 pm

16
40°N 50°N
Rise 4:50 4:36
Set 18:34 18:53

JULY

REFLECTIONS Recently past the quietest solar maximum in decades, fine displays of aurora have not been as common as during previous solar maxima. Here the observer had the pleasure of seeing the aurora reflected on a lake, adding to the fine display. | PHOTO BY WARREN FINLAY

AUGUST

CLUSTER WITH SAPPHIRES Messier 3 (NGC 5272) is considered to be one of the finest globular clusters in the northern sky. It is noted for having a large number of the so-called Blue Stragglers, young main-sequence stars that appear to be much younger than the rest of cluster's stars. Under a dark sky, M3 is a good test of one's eyesight, while through a telescope its view is rivaled in the northern sky by only that of Messier 13. | IMAGE BY STUART HEGGIE

SEPTEMBER

HEART AND SOUL The Heart Nebula (right) and Soul Nebula (left) form an intriguing pair in the northern sky. Located in Cassiopeia at 6 000 light-years away, this is an active star-forming region. | IMAGE BY LYNN HILBORN

OCTOBER

THROUGH THE SHADOW Our Moon slipped through the shadow of planet Earth during the wee hours on 2014 April 15. Our planet's atmosphere acting like a lens refracted the longer red wavelengths of light around the globe and onto the eclipsed Moon, giving it the eerie copper-red glow, an event that will occur twice again this year. | PHOTO BY MICHAEL WATSON

FRIDAY

SATURDAY

THE PLANETS THIS MONTH

Mercury	very low in E at first of month, very low by mid-month and lost in twilight by month-end
Venus	low in E in morning twilight
Mars	low in E in morning twilight
Jupiter	in E in morning twilight
Saturn	very low in SW after sunset, lost in twilight late this month

SEP	S	M	T	W	T	F	S
		1	2	3	4	5

Times in the upper half of the daily boxes are in the 24-hour clock; times in the lower half are given in the 12-hour clock.
Eastern time is used, except for rise and set events and changes to/from Daylight Saving Time, which are given in local time.
Times for events involving planetary satellites refer to the start time.
Detailed instructions on adjusting times for location are given in the back pages.
Please see back pages for photo details and additional information about this Calendar.

1
Moon occults Theta 1&2 Tauri north of graze from Seattle-Saskatoon late this evening

2
Two shadows on Jupiter visible in W of N. America except Alaska 8:26 am
Moon occults Aldebaran before dawn in the W, after sunrise in the E.

3
15 Eunomia at opposition (m=7.9)
1st Mars meteorite found, is observed to fall in Chassigny, France, 200 years ago

4
Last Quarter 17:06
Regulus climbing towards Venus this week, at dawn
Follow Sirius unaided into daylight this week

5
Moon occults Lambda Gem N of graze Los Angeles - Philadelphia before sunrise

6
471 Papagena at opposition (m=9.5)

7
G. de Vaucouleurs, who first suggested local supercluster of galaxies, died 20 years ago

8
Venus-Regulus-Crescent Moon at dawn
Moon occults Omicron Leonis visible in New England and E Canada before dawn

9
Try to spot Uranus (m=5.7) unaided this weekend
Venus 2.5° right of Regulus, closest approach
Jupiter-Mars-Crescent Moon at dawn

10
S Taurid meteors (ZHR=5)

11
Crescent Moon 1.1° lower right of Mercury this morning
Regulus climbing away from Venus this week
Zodiacal Light readily visible from a dark site in E before morning twilight for the next two weeks

12
New Moon 20:06
THANKSGIVING DAY (CANADA)
COLUMBUS DAY (USA)
Uranus at opposition (m=5.7)
Mars approaching Jupiter this week, at dawn

13
Orionid meteors (ZHR=20) 6 pm

14
ISLAMIC NEW YEAR

15
Crescent Moon 8° right of Saturn early this evening

16
Try to spot Uranus (m=5.7) unaided this weekend
Mercury at greatest elongation (18° W), best morning apparition of the year (m=-0.5)
Crescent Moon 5° upper left of Saturn early this evening

17
Mars 0.4° upper left of Jupiter this morning, closest approach

18
Two shadows on Jupiter visible in all of N. America except W and NE 6:42 am
Mars 0.4° left of Jupiter

19
Lunar X near crater Werner visible in all of N. America except E 10 pm
Jupiter climbing away from Mars this week, at dawn

20
First Quarter 16:31
Lunar Straight Wall this evening

21
Orionid meteors (ZHR=20) 6 pm

22
Radio astronomy pioneer Karl Jansky born 110 years ago

23
Venus 1.7° upper right of Jupiter

24
Venus 1.7° upper right of Jupiter

25
Two shadows on Jupiter visible in W of N. America 8:36 am
Venus 1.2° right of Jupiter at dawn
29 Amphitrite at opposition (m=8.7)

26
Venus at greatest elongation (46° W) this morning
Venus-Jupiter-Mars tightest grouping

27
Full Moon 8:05
Venus sinking down from Jupiter this week
Today's full Moon is the Hunter's Moon

28

29

30
Venus within 2° upper right of Mars at dawn, approaching

31
HALLOWE'EN

NOVEMBER

TWILIGHT PAIRING A beautiful conjunction of our Moon with the planet Mercury at left is a striking sight. Difficult targets for many, Mercury, a young crescent Moon about 28 hours old, and the earthshine on the dark side of the Moon make this view of all three in one an observation to remember. | IMAGE BY PETER CERAVOLO.

DECEMBER

ELEPHANT, BAT, AND SQUID? An elephant, a bat, and a squid share this view. The dark silhouette of the Elephant Trunk can be found in the nebula at upper right, while the Bat is the large red nebula at lower left. Hidden in the Bat is the newly discovered (2011) squid-shaped object that appears to be a planetary nebulae. | PHOTO BY LYNN HILBORN

January (Cosmic Fluorescence)
A composite image made from 15 × 10 min in H α ; 8 × 5 min in RGB for a total exposure of 4.5 hours. Image was taken from Flesherton, Ontario, April 2014 using Apogee U16M w Astrodon 5nm H α filter with a Takahashi FSQ f/5 Fluorite Refractor on a Paramount ME guided with an SBIG ST-402ME. Image by Stuart Heggie.

February (Disk Space)
A stitched panorama composed of 6 segments, each taken with an 8-mm fisheye lens on a Canon 5D Mark II. Each segment is a 1-minute untracked exposure at f/3.5 and ISO 4000. Image by Alan Dyer.

March (One Moon, Two Faces)
A composite image from two frames. Left is a 2.6-second exposure and right is a 1/320-second exposure, both with a Nikon D800 on an Explore Scientific 152-mm, f/8 refracting telescope, taken on 2014 April 2. Image was processed in Photoshop CS6. Photo by Michael Watson.

April (Silver Coin)
A composite image made from 2.5-minute exposures totalling in L 113 min, R 60 min, G 55 min, and B 60 mins, for a total exposure of 4.8 hours. Image was taken from the Space Atacama Lodge, Chile, using Apogee U16M with a Ceravolo 300 Astrograph at f/9 on a Paramount ME. Image by Debra and Peter Ceravolo.

May (Gum Nebula)
A composite image made from a stack of 10 × 12-minute exposures with the Borg 77-mm autographic Apo refractor at f/4.3 (330 mm focal length) and the filter-modified Canon 5D Mark II at ISO 800. Taken from Coonabarabran, Australia, March 2014. Photo by Alan Dyer.

June (Hoodoos and the Milky Way)
A single image from a 59-sec exposure at 15 mm with a fisheye lens at f/2.8 using a Canon 6D at ISO 3200. Taken from Writing-on-Stone Provincial Park, Alberta, 2014 May 26. Photo by Warren Finlay.

July (Reflections)
A single image from a 13-sec exposure with a 15-mm fisheye lens at f/2.8 using a Canon 6D at ISO 3200. Taken from Berry Creek northeast of Hanna, Alberta, 2014 April 30. Photo by Warren Finlay.

August (Cluster with Sapphires)
A composite image made from 6 × 10 min exposures in each LRG and B for a total exposure of 4 hours. Image was taken from Flesherton, Ontario, April 2014 using Apogee U16M with a 12.5" Planewave CDK on a Paramount ME guided with an SBIG ST-402ME. Image by Stuart Heggie.

September (Heart and Soul)
A composite image made from 3 × 30 min exposures in each H α , OIII, SII for a total exposure of 4.5 hours, with a 200-mm Canon lens at f/2.8 and an ML8300 camera. Image processed using the Hubble Palette of colours. Taken from the Whistlestop Observatory, Grafton, Ontario, by Lynn Hilborn.

October (Through the Shadow)
A composite image from multiple frames of 1.6 seconds each at ISO 400 taken over 1 hour and 42 minutes, from 01:53 CDT to 03:35 CDT with a Nikon D800 on an Explore Scientific 152-mm f/8 refracting telescope. Frames were stacked in RegiStar, then processed in Photoshop CS6. Photo by Michael Watson.

November (Twilight Pairing)
A single image exposed for 3.2 secs at ISO 200 with a Canon 60D and a focal length of 120 mm on a still tripod. Image was taken from Anarchist Mountain, Osoyoos, B.C., 2014 January 31. Image by Peter Ceravolo.

December (Elephant, Bat, and Squid?)
A composite image made from 8 × 30 mins in OIII, 14 × 15 mins in H α , 6 × 10 mins in R, G, and B, for total of 11 hours. Taken with a Canon 135-mm f/2.5 lens and an FLI ML8300 camera binned 1×1 and Baader filters. Image was taken on 2014 June 22, 26, 27, and July 1 from the WhistleStop Observatory, Grafton, Ontario, by Lynn Hilborn.

Most of the data appearing in the monthly grids was generated using custom software written by Dave Lane, Alister Ling, and Larry McNish. The Moon images were created using custom software written by Alister Ling.

The Royal Astronomical Society of Canada

Since it was founded in 1890, the RASC has filled a special role in both amateur and professional astronomy. Today, it has over 4500 members worldwide who share a passion for the night sky and make contributions to astronomy in many ways.

The RASC has a long tradition of high-quality, volunteer-produced publications. *The Observer's Handbook* has been published since 1907 and is recognized worldwide as the leading

handbook of its type. The *Journal*, also published since 1907, contains articles of interest to amateur astronomers. *The Beginner's Observing Guide* is an introduction to the night sky for the novice observer, the *Observer's Calendar* is a forum for astro-photography by amateur astronomers, and *Skyways* (available in French as *Explorons l'Astronomie*) is an astronomy teacher's guide.

For information on joining the Society, or to order an RASC publication, visit www.rasc.ca or contact the National Office at:

203-4920 Dundas Street West
Toronto ON M9A 1B7 Canada
Phone: (416) 924-7973
Email: nationaloffice@rasc.ca

How to Use this Calendar

A graphical representation of the Moon's appearance in the late evening is given in each daily box. In addition to the varying phase, the depicted size of the Moon varies, reflecting the change in the apparent size of the Moon in the sky as it moves closer to or farther from Earth. The depicted face of the Moon also changes slightly to reflect lunar libration, the rocking motion of the Moon, which means that over time approximately 59% of the lunar surface can be seen from Earth. A small dot of size proportional to the amount of libration appears near the lunar limb that is librated. These daily lunar graphics were prepared using images provided by Roger Fell.

Daily Moon and weekly Sun rise and set times, and the times of Moon phases, are shown in the top portion of the boxes. If no Moon rise or set time is given, this event occurs the next day.

A summary of the naked-eye visibility and position of the planets is given each month. Descriptions are for approximate latitude 45° and, unless otherwise stated, apply to midmonth; rise and set times at the beginning or end of the month may vary by an hour or more from those given. Times and compass directions may also differ somewhat from the given ones at other latitudes.

Special astronomical events are given at the bottom of the daily boxes. Events observable in some part of Canada or the continental United States are listed. Days on which particularly interesting phenomena or events occur are highlighted with a green bar under the date. Detailed information on all events, including their visibility from particular locations, may be determined by consulting the *Observer's Handbook*, which is published annually by the RASC.

Adjustments for Actual Location

When it is in effect, times are adjusted for Daylight Saving Time. Moon phases and special events are given in Eastern time. The user's local time for events other than Moon and Sun rise and set may be determined by converting the given time to the user's time zone (e.g. Pacific time is Eastern time minus 3 hours). For occultations, a further adjustment of an hour or more may be needed for any particular geographical location because of parallax effects. Parallax also means that actual angular separations for events involving the Moon may vary by close to 1° from

those given. Also, the Moon's rapid movement of approximately 0.5° per hour means that separations may be considerably larger at a time that is even a few hours away from the given time.

Two sets of rise and set times are given to accommodate North American observers in midnorthern latitudes. Times are displayed for locations 40°N latitude and 75°W longitude and for 50°N, 75°W. The actual times for a given location must be calculated using the tables at the right.

The tables give (longitude) corrections in minutes to the tabulated rise and set times for selected Canadian and U.S. cities. In the column labelled **Correction**, an entry such as 50°N + 25 means add 25 minutes to the displayed 50°N time. This computed time is an approximation. In the column labelled **Accuracy**, the approximate maximum error in minutes for Moon rise and set using this method is indicated. The error for Sun rise and set is less. These errors can be substantially reduced by interpolating according to latitude, as explained in the following section. Note that the rise and set times calculated using the above method will be local times. It is not necessary to adjust them for time zone.

Other Locations, and Improving Accuracy

For locations not listed in the tables at right, the user should calculate a correction factor. This amount is +4 minutes for each degree that the user's location is west of the central meridian of the user's time zone or -4 minutes for each degree that it is east. This correction factor should be added to the displayed 50°N or 40°N time for the location whose latitude is nearest that of the user's site. The accuracy in minutes for Moon rise and set can be calculated by multiplying the difference between the user's latitude and 50°N/40°N respectively by 4.5, and then adding 0.2 times the difference between the user's longitude and 75°W.

Improvement in accuracy may be obtained for many sites by interpolating or extrapolating the 50°N and 40°N times depending on the user's latitude. For example, the latitude of Ottawa is approximately midway between 50°N and 40°N. An observer in Ottawa can improve accuracy to better than 5 minutes by averaging the given 50°N and 40°N times and then adding the correction factor for Ottawa, which is 3 minutes. Western observers may gain additional accuracy by adding about 10% of the difference between the listed time and the next day's time.

The Royal Astronomical Society of Canada Observer's Calendar 2015

All photos in this unique Calendar were taken by members of The Royal Astronomical Society of Canada (RASC) who are astronomy enthusiasts. It was produced by volunteer members of The Royal Astronomical Society of Canada.

This Calendar includes comprehensive listings of astronomical data such as lunar and planetary conjunctions, Sun and Moon rise and set times, eclipses, meteor showers, and Moon phases.
